The Good:

This project was very different than the other projects, so we had to work together as a group and utilize a lot of new resources to get the task done. We decided to split the work up based on tasks, since each task utilized a different file. This allowed us to concurrently work on the files without overlapping each other. One key thing we did well was share information with each other as we learned it. To start, we had to get SQL hooked up to php. Once this was completed we decided to use input validation on the form to ensure that the correct data would be fed into the database. We also prepared the SQL statements to verify that the data that would be read in was clean and not subject to an SQL injection.

The Bad:

Unfortunately, we did run into some problems. Figuring out how to actually connect to the database through php was the hardest part of the assignment. We also had some difficulty making the form format properly.

Team Contributions:

Jaytonn

- Got the table to display the DB information
- Set up the manager html

Cristian

- Connected the Database to php
- Formatted the input for the add film form

Caleb

- Provided the insert statement
- Utilized try-catch validation
